Primitive Variable Types (cont)		
volatile type	Flags variable as unpredictable (compiler cannot optimise.)	
Storage Classes		
register	Quick access required. May be stored in RAM OR a register. Maximum size is register size.	
static	Retained when out of scope. static global variables are confined to the scope of the compiled object file they were declared in.	
extern	Variable is declared by another file.	
Typecasting		
(type)a	Returns a as data type.	

Primitive Variable Types (cont)		
char $x = 1$, $y = 2$; float $z = (float) x / y$;		
Some types (denoted with OR) are architecture dependant.		
There is no primitive boolean type, only zero (false, 0) and non-zero (true, usually 1.)

Type Definitions (cont)		
<pre>typedef enum typeName{false,</pre>	true}bool;	Creating an enumerated
		bool type.
Declaring		
uint16 $x = 65535;$		Variable x
		as type uin
		t16.
newType $y = \{0, 0\};$		Structure y
		as type new
		Type.

	as type new
	Type.
Unions	
Defining	
<pre>union uName{int x; char y[8];}</pre>	A union type uName with two members, x & y. Size is same as biggest member size.
Declaring	
union uN vName;	A variable vName as union type uN.
Accessing	
vName.y[int]	Members cannot store values concurrently. Setting y will corrupt x.

Unions are used for storing multiple data types in the same area of memory.

Enumeration	
Defining	
<pre>enum bool { false, true };</pre>	A custom data type bool with two possible states: false or true.
Declaring	
enum bool varName;	A variable varName of data type bool.
Assigning	
<pre>varName = true;</pre>	Variable varName can only be assigned values of either fal se or true.
Evaluating	
<pre>if(varName == false)</pre>	Testing the value of varName.

Pointers	
Declaring	
type *x;	Pointers have a data type like normal variables.
void *v;	They can also have an incomplete type. Operators other than assignment cannot be applied as the length of the type is unknown.

By **Ashlyn Black** (Ashlyn Black) cheatography.com/ashlynblack/

by Ashlyn Black (Ashlyn Black) via cheatography.com/20410/cs/3196/

Pointers (cont)		
struct type *y;	A data structure pointer.	
type z[];	An array/string name can be used as a pointer to the first array element.	
Accessing		
х	A memory address.	
*x	Value stored at that address.	
у->а	Value stored in structure pointer $ \mathbf{y} $ member a.	
&varName	$\label{eq:memory address of normal variable varNam} \mbox{e.}$	
*(type *)v	Dereferencing a void pointer as a type pointer.	
A pointer is a variable that holds a memory location.		

Arrays	
Declaring	
<pre>type name[int];</pre>	You set array length.
type name[int] = $\{x, y, z\};$	You set array length and initialise elements.

Arrays (cont)	
<pre>type name[int] = {x};</pre>	You set array length and initialise all elements to x.
type name[] = $\{x, y, z\};$	Compiler sets array length based on initial elements.
Size cannot be changed after de	eclaration.
Dimensions	
name[int]	One dimension array.
name[int][int]	Two dimensional array.
Accessing	
name[int]	Value of element in t in array name.
*(name + int)	Same as name[int].
Elements are contiguously numbered a	scending from 0.
&name[int]	Memory address of element int in array name.
name + int	Same as &n ame [int].
Elements are stored in contiguou	s memory.
Measuring	
<pre>sizeof(array) / sizeof(arrayType)</pre>	Returns length of ar ray. (Unsafe)

Arrays (cont)

 $\label{eq:size-of-array} size of (array[0]) \qquad \mbox{Returns length of arr} \\ \mbox{ay. } \textit{(Safe)}$

_				
	п	n	М	e.
-01		ш.	м.	•
			~	

'A' character	Single quotes.
"AB" string	Double quotes.
\0	Null terminator.

Strings are char arrays.

char name[4] = "Ash";

is equivalent to

char name[4] = {'A', 's', 'h', '\0'};
int i; for(i = 0; name[i]; i++){}

\0 evaluates as false.

Strings must include a char element for \0.

Escape Characters

alarm (bell/beep) \b backspace ∖a \f formfeed \n newline horizontal tab \r carriage return \t backslash vertical tab $\backslash \nabla$ single quote double quote

Escape Characters (cont)			
/ ?	question mark		
\nnn	Any octal ANSI character code.		
\xhh	Any hexadecimal ANSI character code.		

Functions

Declaring

type/void funcName([args...]) { [return var;] }

Function names follow the same restrictions as variable names but must **also** be unique.

type/void	Return value type (void if none.)
funcName()	Function name and argument parenthesis.
args	Argument types & names (void if none.)
{ }	Function content delimiters.

Console Input/Output (cont)

fgets(strName, length, stdin); sscanf(strName, "%d", &x)filebses fg

File Input/Output (cont)

String containing file's directory path & name.

modeets to String specifying the file access mode. limit the Modes input "r" / length, Read existing text/binary file. "w"/thenb" Write new/over existing text/binary file. "a"/**uses** ss Write new/append to existing text/binary file. "r+"/"r+b"/"r Read and write existing text/binary file. read the resulting "w+" string in" Read and write new/over existing text/binary b+" place of "a+"\$c"anfb" / "a Read and write new/append to existing

b+" (safe)

text/binary file.

Closing

The stream buffers must be flushed to reflect changes. String terminator characters can flush the output while newline characters can flush the input.

Safe functions are those that let you specify the length of the input. Unsafe functions do not, and carry the risk of memory overflow.

File Input/Output

#include <stdio.h>

Opening

FILE *fptr = fopen(filename, mode);

Declares fptr as a FILE type pointer (stores

stream location instead of memory location.)

fopen() Returns a stream location pointer if successful, 0

otherwise.

Placeholder Types (f/printf And f/scanf) (cont)

No output, saves # of characters printed so far. Respective printf argument must be an integer pointer.

The pointer format is architecture and implementation dependant.

Placeholder Formatting (f/printf And f/scanf)

%[Flags][Width][.Precision][Length]Type

Flags	
-	Left justify instead of default right justify.
+	Sign for both positive numbers and negative.
#	Precede with 0, 0x or 0X for %o, %x and %X tokens.
space	Left pad with spaces.
0	Left pad with zeroes.
Width	
integer	Minimum number of characters to print: invokes padding

Width specified by a preceding argument in printf.

Precision

.integer Minimum # of digits to print for %d, %i, %o, %u, %x, %X. Left pads with zeroes. Will not truncate. Skips values Minimum # of digits to print after decimal point for %a, %A, %e, %E, %f, %F (default of 6.) Minimum # of significant digits to print for %g & %G. Maximum # of characters to print from %s (a string.)

If no integer is given, default of 0.

Precision specified by a preceding argument in print

Length	
hh	Display a char as int.
h	Display a short as int.
1	Display a long integer.
11	Display a long long integer.
L	Display a long double float.
Z	Display a size_t integer.

By Ashlyn Black (Ashlyn Black) cheatography.com/ashlynblack/

if necessary. Will not truncate.

Heap Space (cont)

realloc(ptrName, size); Attempts to resize the memory block assigned to ptrName.

The memory addresses you see are from virtual memory the operating system assigns to the program; they are not physical addresses.

Referencing memory that isn't assigned to the program will produce an OS segmentation fault.

The Standard Library

#include <stdlib.h>

Randomicity	
rand()	Returns a (predictable) random integer between 0 and RAND_MAX based on the randomiser seed.
RAND_MAX	The maximum value ${\tt rand}()$ can generate.
<pre>srand(unsigned integer);</pre>	Seeds the randomiser with a positive integer.
(unsigned) time(NULL)	Returns the computer's tick-tock

The Standard Library (co	ont)						
Sorting							
	qsort(ar	ray,	len	gth,	size	of(t	type),
qsort()				Sort u	ising th	e Qı	uickSort a

The Character Type Library		
	<pre>#include <ctype.h></ctype.h></pre>	
tolower(char)	Lowercase char.	
toupper(char)	Uppercase char.	
isalpha(char)	True if char is a letter of the alphabet, false otherwise.	
islower(char)	True if char is a lowercase letter of the alphabet, false otherwise.	
isupper(char)	True if char is an uppercase letter of the alphabet, false otherwise.	
isnumber(char)	True if char is numerical (0 to 9) and false otherwise.	
isblank	True if char is a whitespace character (' ', '\t', '\n') and false otherwise.	

The String Library	
#	include <string.h></string.h>
strlen(a)	Returns # of char in string a as an integer. Excludes \0. (unsafe)
strcpy(a, b)	Copies strings. Copies string b over string a up to and including \0. (unsafe)
strcat(a, b)	Concatenates strings. Copies string b over string a up to and including $\ 0$, starting at the position of $\ 0$ in string a . (unsafe)
strcmp(a, b)	Compares strings. Returns <i>false</i> if string a equals string b, <i>true</i> otherwise. Ignores characters after \0. <i>(unsafe)</i>
strstr(a, b)	Searches for string b inside string a. Returns a pointer if successful, NULL otherwise. (unsafe)
Alternatives	
strncpy(a, b, n)	Copies strings. Copies n characters from string b over string a up to and including $\ 0$. (safe)

Strncat (a, b, n) Concatenates strings. Copies n characters of two string a, b, n) Compares first n characters of two	
at mamp (a b n) Compares first n characters of two	nd
Returns false if string a equals str otherwise. Ignores characters afte (safe)	ing b, <i>true</i>

Safe functions are those that let you specify the length of the input.

Unsafe functions do not, and carry the risk of memory overflow.

The Time Library	
	<pre>#include <time.h></time.h></pre>
Variable Types	
time_t	Stores the calendar time.
struct tm *x;	Stores a time & date breakdown.
tm structure members.	•
int tm_sec	Seconds, 0 to 59.
int tm_min	Minutes, 0 to 59.
int tm_hour	Hours, 0 to 23.
int tm mday	Day of the month, 1 to 31.

The Time Library (cont)	
int tm_mon	Month, 0 to 11.
int tm_year	Years since 1900.
int tm_wday	Day of the week, 0 to 6.
int tm_yday	Day of the year, 0 to 365.
int tm_isdst	Daylight saving time.
Functions	
time(NULL)	Returns unix epoch time (seconds since 1/Jan/1970.)
<pre>time(&time_t);</pre>	Stores the current time in a time _t variable.
ctime(&time_t)	Returns a time_t variable as a string.
<pre>x = localtime(&time_t);</pre>	Breaks time_t down into stru ct tm members.

Unary Operators		
by de	scending evaluation precedence	
+a	Sum of 0 (zero) and a. (0 + a)	
-a	Difference of 0 (zero) and a. (0 - a)	
!a	Complement (logical NOT) of a. (~a)	

By **Ashlyn Black** (Ashlyn Black) cheatography.com/ashlynblack/

by Ashlyn Black (Ashlyn Black) via cheatography.com/20410/cs/3196/

Unary Operators (cont)		
~a	Binary ones complement (bitwise NOT) of a. (~a)	
++a	Increment of a by 1. $(a = a + 1)$	
a	Decrement of a by 1. (a = a - 1)	
a++	Returns a then increments a by 1. (a = a + 1)	
a	Returns a then decrements a by 1. (a = a - 1)	
(type)a	Typecasts a as type.	
&a	Memory location of a.	
sizeof(a)	Memory size of a (or type) in bytes.	

Binary Operators		
by descer	nding evaluation precedence	
a * b;	Product of a and b. (a × b)	
a / b;	Quotient of dividend $\tt a$ and divisor $\tt b$. Ensure divisor is non-zero. (a \div b)	
a % b;	Remainder of integers dividend a and divisor b.	
a + b;	Sum of a and b.	
a - b;	Difference of a and b.	

Binary Operators (cont)		
a << b;	Left bitwise shift of a by b places. (a $\times 2^b$)	
a >> b;	Right bitwise shift of a by b places. (a $\times 2^{-b}$)	
a < b;	Less than. True if \mathtt{a} is less than \mathtt{b} and false otherwise.	
a <= b;	Less than or equal to. True if a is less than or equal to b and false otherwise. (a \leq b)	
a > b;	Greater than. True if ${\tt a}$ is greater than than ${\tt b}$ and false otherwise.	
a >= b;	Greater than or equal to. True if a is greater than or equal to b and false otherwise. (a \geq b)	
a == b;	Equality. True if a is equal to b and false otherwise. (a \Leftrightarrow b)	
a != b;	Inequality. True if a is not equal to b and false otherwise. (a \neq b)	
a & b;	Bitwise AND of a and b. (a \cap b)	
a ^ b;	Bitwise exclusive-OR of a and b. (a \oplus b)	

By **Ashlyn Black** (Ashlyn Black) cheatography.com/ashlynblack/

Binary	Operators	(cont)

a b;	Bitwise inclusive-OR of a and b. (a \cup b)
a && b;	Logical AND. True if both a and b are non-zero. (Logical AND) (a \cap b)
a b;	Logical OR. True if either a or b are non-zero. (Logical OR) (a \cup b)

Ternary & Assignment Operators

,	, ,,	1 "	,
bu	descending /	evaluation	precedence

x ? a : b;	Evaluates a if ${\tt x}$ evaluates as true or ${\tt b}$ otherwise.
	(if(x){ a; } else { b; })
x = a;	Assigns value of a to \mathbf{x} .
a *= b;	Assigns product of a and b to a. (a = $a \times b$)
a /= b;	Assigns quotient of dividend \mathtt{a} and divisor \mathtt{b} to $\mathtt{a}.$ (a
	= a ÷ b)
a %= b;	Assigns remainder of integers dividend a and

divisor b to a. (a = a mod b)

Assigns sum of a and b to a. (a = a + b)

Tornon	, P Acci	anmont O	norotore i	(aont)
remary	a Assi	grinnent O	perators ((COLIL)

a -= b;	Assigns difference of a and b to a. (a = a - b)
a <<= b;	Assigns left bitwise shift of a by b places to a. (a = a × 2^b)
a >>= b;	Assigns right bitwise shift of a by b places to a. (a = a $\times 2^{-b}$)
a &= b;	Assigns bitwise AND of a and b to a. (a = a \cap b)
a ^= b;	Assigns bitwise exclusive-OR of a and b to a. (a = a \oplus b)
a = b;	Assigns bitwise inclusive-OR of a and b to a. (a = a \cup b)

C Cheatsheet by Ashlyn Black
